## 1.0 INTRODUCTION

This report presents the results of a geotechnical and acid sulfate soils (ASS) investigation carried out by Core Consultants Pty Ltd (Core) for a proposed multi-storey residential development at 260 Macarthur Avenue, Hamilton. The site consists of Lot 6 on SP326594 (Site 18) with the area split into the eastern portion (Site 18A), in discussion, and the western portion (Site 18B), set aside for future development.

The work was carried out for Silverstone Developments (SD), in accordance with our proposal Q005146-001-L-Rev0, dated 13 June 2024.

## 2.0 PROPOSED DEVELOPMENT

The proposed development includes two buildings of 9 and 12 levels over a shared single-level inground basement, as shown in Images 1 to 3 below. Basement levels are to be finalised but bulk excavation to about RL 1.8 m with finished ground level at RL5.9 m (easement ) and RL 4.720m (Footpath to Angora Road).

Image 1: Extract from proposed precinct development plan (Carr.

Image 2: Extract from proposed development plan at ground level (Carr 24047-TP2-1002).

Image 3: Extract from proposed development Section plan (Carr 24047-TP2-3002).

### 3.0 SITE DESCRIPTION

The site is located at 260 Macarthur Avenue, Hamilton. Site 17 previously defined and is not a part of this report. Site 18 comprises Lot 6 on SP326594 which covers 14740 m<sup>2</sup>. Site 18 is split into two portions, Site 18A the eastern portion and 18B western portion for future development. The site location is shown in Image 4 below.

Image 4: Site location (Aerial image sourced from Nearmap, Annotations by Core).

#### 3.1 Site 18 (Lot 6 SP326594)

Site 18 (currently known as Lot 6 on SP326594) was entirely fenced and comprised an area of grass, bitumen sealed carparking area, concrete pads, a single storey warehouse and a few established trees along the south western boundary. Lot 6 was used for storage of construction equipment with multiple shipping containers observed and metal structure beams stacked over the bitumen hardstand areas. Light poles, in working order, were evident across the site (refer to photographs 1 and 2).

The elevation of the site ranges between about RL 4.3 m and 5.0 m Australian Height Datum (AHD), generally sloping down towards the southern boundary.

Karakul Road bounds Site 18 (6 on SP326594) to the north and east, followed by Site 17 (Lot 5 on SP326594). To the south east the site is bounded by Angora Road, with Sales and Display Centre for Northshore developments. Macarthur Avenue bounds the south followed by Northshore Tennis and carparking facility. To the west Barcham Road form the western boundary, followed by Northshore industrial development areas. The Brisbane River is located approximately 150 m to the south, with the cruise terminal approximately 200 m to the south west. Access is currently available from Karakul Road and Angora Road.

**Photograph 1: Site 18 (Lot 6 SP326594) looking northwest towards the Corner of Karakul Road and Barcham Road.**

**Photograph 2: Site 18 looking east towards Angora Road.**

## **4.0 METHOD OF INVESTIGATION**

### **4.1 Review of Available Information**

To assess likely ground conditions a review of published geological maps, aerial images, acid sulfate soils (ASS) maps and available geotechnical information was undertaken (refer Section 5).

### **4.2 Boreholes and Test Pits**

Boreholes were drilled between 19 and 20 June 2024 in the presence of geotechnical personnel from Core, at the locations shown on the attached Figure 1 (Appendix A). Borehole positions were recorded in the field using a handheld GPS unit. All Boreholes were auger drilled using a 4WD mounted drill rig.

Site 18 (Lot 6 SP326594) comprised the following fieldwork:

- Six (6) boreholes (designated BH1 to BH6) auger-drilled to 3 m BGL
- Standard Penetration Testing (SPT) conducted at regular intervals in the boreholes with disturbed and undisturbed samples collected
- ASS samples were collected at 0.25 m intervals to 3 m BGL
- Dynamic Cone Penetrometer (DCP) testing was conducted within the boreholes to 1 m BGL
- A groundwater standpipe was installed on-site in BH2 and BH6 (denoted MW01 and MW02) and two were installed off-site for groundwater level measurement and sampling; the other boreholes were backfilled with drilled spoils and patched with cold-mix asphalt at the surface.

### 4.3 Geophysical Testing

Geophysical testing in the form of multi-channel analysis of surface waves (MASW) was undertaken on 9 July 2024 by a geotechnical engineer/engineering geophysicist from Core and comprised four survey alignments, Lines 1 and 2 in Lot 17 (Lot 5 SP326594) and Lines 3 and 4 in Lot 18 (Lot 6 SP326594).

MASW geophysical surveys use seismic surface (Rayleigh) wave phase and frequency data to estimate shear-wave velocities of the subsurface materials.

The MASW acquisition comprised the use of a 24-channel land streamer array with 4.5 Hz geophones spaced horizontally at 1 m. Each survey comprises a single 1-Dimensional vertical sounding recorded at the centre of the geophone array; as shown on Image 1 below. Vertical soundings were carried out at approximately 10 m intervals along each survey line.

The array was connected to a Geometrics Geode, with data recorded using the Geometrics Seismodule Controller Software (SCS). A sampling rate of 0.5 ms and sample record length of 2 seconds was adopted. The seismic source was a 7 kg sledgehammer striking a polyethylene plate, with an offset of 6 m. Vertical stacking of the seismic source was carried out to minimise ambient noise (i.e., wind and traffic) and increase the signal to noise ratio.

Sounding co-ordinates (X-Y-Z) were recorded in the field with a Trimble GNSS device with typically  $\pm 0.2$  m accuracy. Co-ordinates were recorded using Map Grid of Australia (GDA2020) and height above mean sea level (AUSGeoid20).

The acquired data was processed using the *SurfSeis 6* software, by Kansas Geological Society. Dispersion images were generated, which show the frequency versus the percentage intensity of phase velocity, for each acquired field record. A dispersion curve was then produced by picking the maximum intensity velocities (of the fundamental mode) across the useful range of frequencies. The dispersion curves for each survey alignment were put through an 8-layer inversion algorithm to produce one-dimensional shear-wave velocity soundings.

The S-wave soundings were then gridded using Golden Software's *Surfer 22* to produce two-dimensional shear-wave velocity sections.

The quality of the produced MASW dispersion curves for each sounding was typically good, with high signal-to-noise (S/N) ratios for the fundamental-mode dispersion energy, for a frequency range between about 4 Hz and 20 Hz.

Image 5: Example MASW acquisition schematic.

## 4.4 Acid Sulfate Soils Sampling

The ASS component of the investigation was planned based on the findings of a desktop assessment (refer Section 7.0) and with reference to the following 'National Acid Sulfate Soils Guidance' documents:

- National acid sulfate soils sampling and identification methods manual<sup>1</sup>
- National acid sulfate soils identification and laboratory methods manual<sup>2</sup>
- Guidance for the dewatering of acid sulfate soils in shallow groundwater requirements<sup>3</sup>
- Queensland State Planning Policy 2017 (SPP17)<sup>4</sup>

For this assessment, samples were recovered from six boreholes (BH1 – BH6) at 0.25 m intervals to a depth of 3 m BGL. ASS sampling protocols in the field were conducted to minimise oxidation prior to laboratory testing and followed the above referenced guidelines.

## 4.5 Groundwater Sampling

Groundwater sampling was undertaken in accordance with the following:

- Department of Environment Science and Innovation (DESI) Monitoring and Sampling Manual 2018.
- Groundwater was assessed using the Environmental Protection (Water and Wetland Biodiversity) Policy 2019 *Brisbane River Estuary Environmental Values and Water Quality Objectives Part of Basin 143*.

The site is located within the Brisbane River Estuary – middle estuary waters area with the water quality objectives adopted for the environmental Value Zone and water type.

For this assessment, samples were recovered from the four monitoring wells (MW01 to MW04), two located on-site (Lot 6 SP326594) and two located off-site on neighbouring property (Lot 5 SP337697) that were installed to a depth of 3 m BGL. Samples were immediately placed in airtight containers supplied by the testing laboratory and then placed into a chilled insulated esky for transportation to the laboratory.

## 4.6 Laboratory Testing

### 4.6.1 Geotechnical Testing

Soil samples were forwarded to a NATA-accredited laboratory for geotechnical laboratory classification testing comprising particle size distribution, Atterberg limits, Emerson class, soil aggressivity and soaked CBR testing.

Geotechnical laboratory test results are discussed in Section 5.7.

### 4.6.2 Acid Sulfate Soil Testing

A total of 56 samples were screened for Lot 5 SP337697, to assess field pH ( $pH_F$ ) and pH after oxidation ( $pH_{FOX}$ ) using 30% hydrogen solution.

The  $pH_F/pH_{FOX}$  screening method consists of two steps. In the first step, the field pH of a 1:5 soil/water suspension is measured ( $pH_F$ ). In the second step, a 30% Hydrogen Peroxide solution is added to a second sample of the same material which is then heated to accelerate the oxidation of the sample. The pH after oxidation ( $pH_{FOX}$ ) is then measured. A significant difference between the  $pH_F$  and  $pH_{FOX}$  results is an

<sup>2</sup> Sullivan L, Ward N, Toppler N, Lancaster G, *National Acid Sulfate Soils guidance: National acid sulfate soils identification and laboratory methods manual* (2018), Department of Agriculture and Water Resources, Canberra ACT.

<sup>3</sup> Sullivan L, Ward N, Toppler N, Lancaster G, *National Acid Sulfate Soils guidance: Guidance for the dewatering of acid sulfate soils in shallow groundwater environments* (2018), Department of Agriculture and Water Resources, Canberra ACT.

<sup>4</sup> State Planning Policy (2017), State of Queensland, Department of Infrastructure, Local Government and Planning.

indication of potential acid sulfate soils (PASS); however, test results may be affected by other inclusions such as shell material and organics.

Based on the results of pH screening tests, 17 samples were selected and dispatched to Eurofins to undergo quantitative analysis by the Chromium Reducible Sulfur (CRS) suite in accordance with ASS Method 23F and 22B laboratory procedures of Ahern et al (2004).

This CRS method includes analysis of 'inherent buffering capacity' from naturally occurring alkaline materials (i.e. calcite, coral debris, fine shell fragments) and 'retained acidity' which includes sulfur held in stable oxidation minerals such as 'jarosite' and allows for calculation of 'net acidity'. The CRS test method was selected in preference to the Suspension Peroxide Oxidation Combined Acidity & Sulfur (SPOCAS) method as it gives more accurate indications of pyrite content where significant amounts of organic matter (and organic derived acidity) are present in the soil samples. An overall acid-base accounting method was used to calculate a 'net acidity' value which is used to qualify analytical test results and calculate liming rates. This equation is:

$$\text{Net Acidity} = \text{Actual Acidity (as TAA)} + \text{Retained Acidity (as } S_{\text{NAS}}) + \text{Potential Acidity (as } S_{\text{CR}}) - \text{in situ Acid Neutralising Capacity (ANC)}.$$

Groundwater samples were recovered from the standpipes (MW1 to MW4) and screened in the field, after initial purging. The groundwater sample was then dispatched to Eurofins/MGT (Eurofins) to undergo further water quality analysis.

All sample collection, in-situ testing and dispatch were performed in accordance with Core procedures for water quality monitoring and the Department of Environment and Science (DES) Monitoring and Sampling Manual 2018.

All groundwater samples were analysed for Total and dissolved Aluminium and Iron, Anions Cations, Chloride and Sulphides.

## 5.0 RESULTS

### 5.1 Published Geological Mapping

The Queensland Geotechnical Database (QGD) indicates that the site is located in an area of Quaternary age Anthropocene comprising :*Gravel, sand and silt; man-made deposits generally associated with land-fill or mining (tailings, dumps and rehabilitated areas)*". An extract of the relevant geological map is shown in Image 4 below.

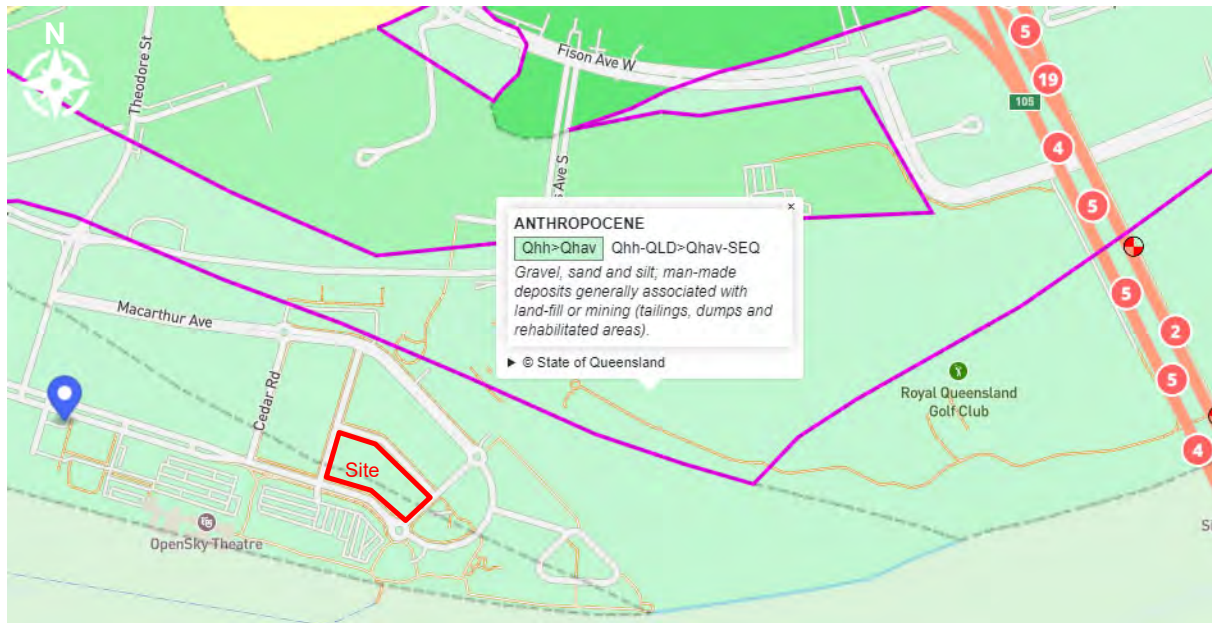

Image 4: Extract from QGD map showing regional geology (not to scale).

## 5.2 Historical Information & Aerial Images

The site history ('Northshore History') indicates that the site consisted of a river inlet until the early 1900's when the area of Hamilton was reclaimed as part of dredging of the Brisbane River to allow safer access for vessels, with the dredge spoil placed behind a 'training wall' across the inlet to create additional land. This dredging and filling process was conducted over decades of time. In 1999 the land was considered high enough to produce a Deed of Grant to the Port of Brisbane. The land was initially leased for shipping freight handling purposes until the 2010's when the land was redeveloped for future community development.

Historical aerial images (QImagery) indicate the following:

- In 1936 and up until 1963 the land was a back channel of the Brisbane River and grass paddocks (refer Image 6a).
- By 1967 (refer Image 6b) land development along the riverbank had started and the river channel was less evident.
- By 1972 (refer Image 6c) surrounding land was largely developed with buildings, although the site itself appeared undeveloped.
- In 1981 (refer Image 6d) there appears to be land reclamation at the site; after that the site appears grassed until the car storage was constructed sometime between 1994 and 1997.
- The site was used for shipping storage until 2009 at which time MacArthur Avenue was constructed and part of the site adjoining MacArthur Avenue became grassed whilst the remainder continued as vehicle storage.
- The vehicle storage was discontinued by late 2020 and construction of local roads had occurred.

Image 5b: 1967 aerial image (QImagery).

Image 5c: 1972 aerial image (QImagery).

Image 5d: 1991 aerial image (QImagery).

### 5.3 Previous Geotechnical Investigations

A previous 'broad-scale' geotechnical investigation has been carried out in the area by Butler Partners, including the current site of interest (refer report *Preliminary Geotechnical Investigation, Proposed High Density Residential Development, 240A, 250 and 280 Macarthur Avenue, Hamilton*, ref. 018-150J, dated October 2020; and Image 6 below).

The previous investigation included four deep boreholes (1 to 4), ten shallow boreholes (5 to 14) and eleven Cone Penetration Tests (CPT 1 to 11). The subsurface profile encountered in boreholes 4, 6 and 12 and inferred in CPTs 3 to 6 in the area of the current site of interest in summary comprised:

#### Site 18 (Lot 6 SP326594)

- Bituminous Concrete of 50 mm thick only in BH4.

- Fill to 1.1 m BGL comprising sandy clayey gravel, and gravelly clayey sand; dynamic cone penetration (DCP) tests indicate this fill was mostly relatively very dense at borehole 6. No records to confirm the fill was placed in a controlled manner were seen (nor would be usually available for dredge spoil placement) and the fill would be considered uncontrolled.
- 'Upper alluvium' (possibly including some dredge spoil?) comprising very soft to firm clay to about 8 to 9 m BGL, then very loose to loose clayey sand (with a firm clay band in places) to about 11.5 to 13.5 m BGL.
- Lower alluvium comprising loose to medium dense clayey sand (with stiff clay bands in places) then medium dense with dense material encountered below about 27 to 31.4 m BGL where the CPTs met refusal.
- Dense sand was encountered at 27.5 m BGL in CPT 5, and 28 m BGL in CPT 6, which extended to the end of the boreholes at 31.92 m and 31.22 m BGL respectively.

Groundwater was encountered mostly at levels of RL 1.1 m to 2.5 m but locally down to RL 0.4 m and up to RL 3.3 m.

The previous investigation included geotechnical laboratory testing as follows:

- Emerson class tests with results of 4 to 5
- Particle size distribution tests with silt/clay fractions of 16% to 54% and sand fractions of 46% to 84%
- Plasticity tests with liquid limits of 55% to 78% and plasticity indexes of 2% to 47%
- Shrink swell tests with shrinkages of 4.5% to 10.1% and shrink swell indexes of 2.4% to 5.7%
- Standard compaction tests with a maximum dry density of 1.76 to 2.08 t/m<sup>3</sup> and optimum moisture contents of 9.3% to 14.5%
- Soaked CBR tests with CBR values of 4%, 15% and 25 %.

The previous ASS laboratory testing indicated that the sand and clay have potential acidity but also contained high levels of acid neutralising capacity (ANC) which appeared to be due to shells. Shells cannot be relied upon for neutralising acidity and are not included in the assessment of nett acidity. The liming rates for the sand fill (in one sample only tested) were found to be 4 kg/t and for the underlying clays varying from 5kg/t to 6 kg/t (e.g. boreholes 1, 2, 7, 12 and 13 but 23 kg/t to 33 kg/t in others, e.g. boreholes 4, 5, 6, 7 and 10).

**Image 6: Previous investigation locations (extract from Butler Partners report, site location by Core).**

A geotechnical investigation was also carried out by Core for the lot adjoining Site 17 (Lot 5 SP326594) immediately to the west which included a deep borehole (BH 7) and Cone penetration Test (CPT6) close to the south west corner of Site 17 (Lot 5 SP326594) (about 40m west of CPT 4). The borehole encountered the following subsurface profile:

- Soft and very soft sandy and silty clay dredge spoil fill to 4.5 m BGL
- Soft silty clay to 7m BGL
- Loose and medium dense silty sand to 11.5m BGL
- Stiff silty or sandy clay to 14.5m BGL
- Very loose and loose clayey sand to 24.8m BGL and then medium dense to 29.5m BGL
- Medium dense to dense sandy gravel to borehole termination at 35.5m BGL

The CPT terminated about 32 m BGL with cone tip resistance of 20 MPa.

#### 5.4 Published Acid Sulfate Soil Information

This site is mapped as a high probability (>70%) for the presence of ASS, likely due to the elevation of the site and proximity to the Brisbane River. An extract of the relevant ASS map is shown in Image 7.

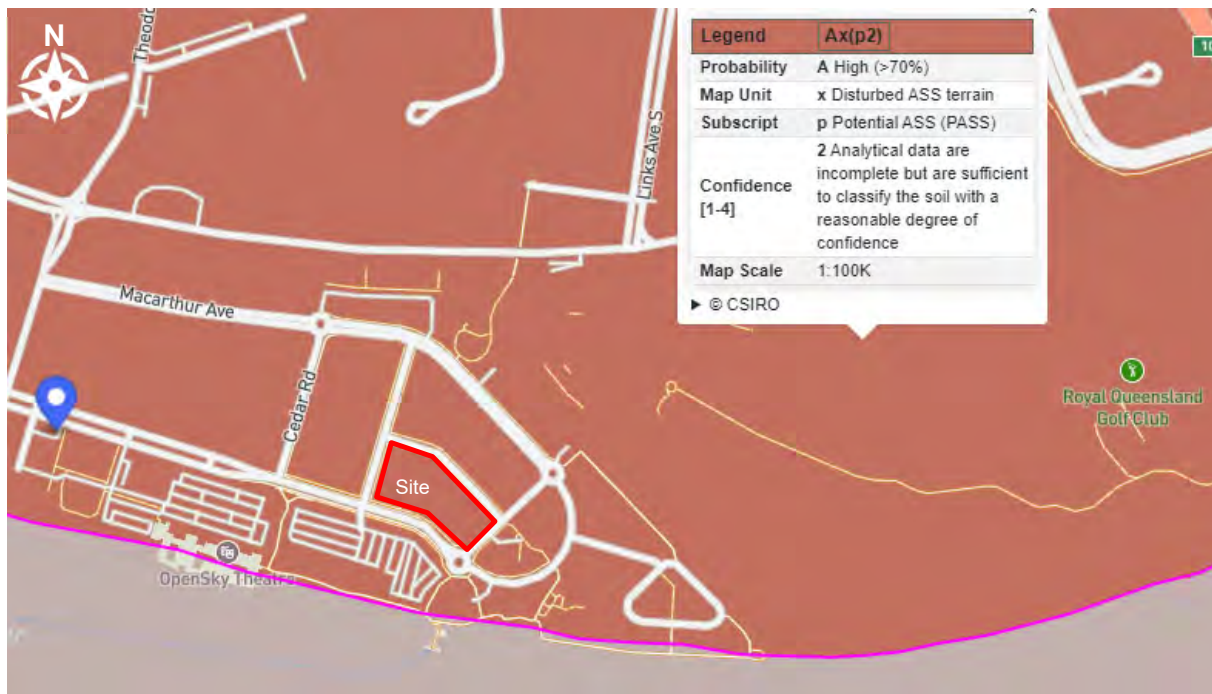

Image 7: Extract from QGD map showing ASS classification (not to scale).

## 5.5 Subsurface Conditions

The locations of boreholes, test pits and geophysical survey line locations are shown on Figure 1 in Appendix A. The Borehole and Test Pits logs are contained in Appendix B and the geophysical survey results are shown in Figure 2 in Appendix A.

The subsurface conditions encountered in the boreholes, test pits, MASW and interpreted from the site history, previous CPT results generally comprised the following:

- Fill, typically firm or stiff gravelly sand with clay, to about 1 to 1.2 m BGL, over
- Fill/dredge spoil comprising soft clay (material likely dredged from the adjacent Brisbane River channel), to depths of possibly about 5 m BGL, although very similar to and difficult to differentiate from the underlying alluvium,
- Upper alluvium, generally comprising interbedded loose sand and firm clay to about 15 m to 20 m BGL, over
- Lower alluvium, generally loose to medium dense sand and stiff clay, becoming medium dense or dense gravel from about 30 m to 32 m BGL.

The upper fill and dredge spoil is considered 'uncontrolled' because of lack of geotechnical inspection and density testing records.

Groundwater seepage was encountered in the auger boreholes at about 2 m BGL at Lot 18 (Lot 6 SP326594) but no groundwater seepage was encountered in any boreholes at Site 17 (Lot 5 SP326594). Groundwater seepage levels in the standpipes at 2.45 m, 2.52 m, 2 m, and 2.39 m BGL respectively were observed during the groundwater samplings. Ordinarily near the Brisbane River where sands are present, groundwater levels would be tidally dominated and occur at or around high tide level about RL 1 m to 1.5 m and rise temporarily and locally due to ingress after rainfall. It is understood the storm tide level for this site is about RL 3.1 m. Groundwater conditions can vary over distance and time and apart from tide and rainfall be influenced by changes to surface and subsurface drainage conditions and human influences.

## 5.6 In Situ Permeability Testing

In situ falling head permeability testing was undertaken in monitoring wells on 20 and 26 June 2024. The test results provided the following indicative permeability ( $k$ ) values:

- BH2/MW01:  $k$  value of  $8.4 \times 10^{-7}$  m/sec
- BH6/MW02:  $k$  value of  $1.5 \times 10^{-6}$  m/sec

## 5.7 Laboratory Testing

Geotechnical laboratory testing was performed at a NATA-accredited laboratory and comprised Atterberg limits, Emerson class and soil aggressivity tests. The laboratory test results are attached in Appendix C and summarised below in Tables 1 to 3. Laboratory test results are discussed further in Section 6.

**Table 1: Summary Particle Size Distribution (PSD), Atterberg Limits and Emerson Class Number (ECN) Testing Results**

| Borehole /Test Pit (no.) | Depth (m) | Soil Description      | PSD (% passing) |           |            |            | Plasticity |        |        |         | LS (%) | ECN |
|--------------------------|-----------|-----------------------|-----------------|-----------|------------|------------|------------|--------|--------|---------|--------|-----|
|                          |           |                       | 4.75 (mm)       | 2.36 (mm) | 0.425 (mm) | 0.075 (mm) | LL (%)     | PL (%) | PI (%) | WPI (%) |        |     |
| BH2                      | 0.5-1.0   | Gravelly sand         | -               | -         | -          | -          | -          | -      | -      | -       | -      | 4   |
| BH4                      | 1.0-1.45  | Sandy clay            | 100             | 100       | 93         | 55         | 41         | 16     | 25     | 2324    | 10.5   | 3   |
| BH6                      | 1.0-1.45  | Silty clay trace sand | 100             | 100       | 100        | 77         | 61         | 21     | 40     | 4000    | 12.0   | -   |

Notes: LL – Liquid Limit, PL – Plastic Limit, PI – Plastic Index, LS – linear shrinkage, WPI – weighted plasticity index (PI x %<0.425mm)

**Table 2: Summary of Compaction and CBR results**

| Borehole/ Test Pit (no.) | Depth (m) | Soil Description | Compaction and CBR       |         |         |           |
|--------------------------|-----------|------------------|--------------------------|---------|---------|-----------|

## 6.0 GEOTECHNICAL COMMENTS & RECOMMENDATIONS

### 6.1 Excavations

Basement excavation is anticipated to encounter predominantly sand or clay fill including dredge spoil. These materials are expected to be excavatable using conventional earthmoving equipment such as excavators up to 8 t in size although larger machines would likely be used for higher production rates. If concrete is encountered, a rock breaker could be required for the removal of concrete (i.e. pavements and building foundations). The sand and the underlying clay should be separated during excavation as they are likely to require differing disposal and treatment requirements.

### 6.2 Temporary Batter Stability

Temporary batters in the sands and clays (up to 2 m deep) could be formed at 1V:1.5H, provided there are no surcharge loads, services or structures close to the excavation crest. Batter slopes will need to be confirmed by a geotechnical engineer at the time of construction. Flatter slopes or temporary support will be required in soft clays or if groundwater is present in the face or toe of the batter.

For excavations where space does not permit temporary batters (e.g. close to the site boundary), engineer-designed temporary support will be required. This could comprise temporary sheet piling, with possibly one or two rows of temporary anchors in the sand fill (due to poor toe support afforded by the soft clays) depending on wall height. Anchors extending beyond the site boundary would require permission from the adjacent landowner. Propping of sheet piles could be considered with angled prop to a block on the subgrade; cross excavation props will not be practical given the large excavation width. A fully piled support system (e.g. contiguous piles) could also be considered which could be incorporated into the structural design (piled foundations / basement wall); but would be significantly greater cost.

### 6.3 Trafficability & Working Platforms

The existing sand subgrade should be trafficable for tracked machines but not trucks and other rubber-tyred machines. Capping with 0.2 m to 0.3 m of granular fill (e.g. recycled 'CBR45') is expected to be required on sand subgrade. For a piling rig with bearing pressures of up to 250 kPa (e.g. driven pile rig), a working platform of 0.3 m to 0.5 m of CBR45 granular fill might be required.

At basement level where clay is encountered, the subgrade be untrafficable for almost all machines. A working platform of at least 0.3 m would be required for smaller machines, underlain by geofabric (which would be beneficial for support for construction of the basement slab). For larger equipment (e.g. piling rig), a substantial working platform of 0.8 m to 1 m or more could be required on the soft clay subgrade (involving over-excavation and additional spoil to manage). Consideration should be given to undertake excavation, and if practical piling, from the existing surface (with piles cut off to design level).

Working platform design must be undertaken by suitably qualified RPEQ when the crane/rig load specifications are known.

### 6.4 Filling

Any localised new filling required to achieve design levels should be undertaken under 'Level 1' inspection and testing as detailed in Australian Standard AS3798-2007 *Guidelines on earthworks for residential and commercial developments*. A low plasticity granular fill (CBR 15 material) should be used, compacted to a minimum Dry Density ratio of 98 % (Standard) within 2 % of optimum moisture content.

### 6.5 Consolidation Settlement

Long term settlements of the land due to compression of the softer clays in the upper alluvium is anticipated (e.g. as evidenced in the road surface adjoining access shafts along Macarthur Avenue). Previous local experience has indicated that the upper alluvial clays are lightly over-consolidated and consolidation settlement should therefore be anticipated under new loads (e.g. from structure or pavements supported on ground and not piles, or fill). The primary consolidation settlements might range up to about 75 mm for assumed new development loads not exceeding 20 kPa. If larger loads are proposed then higher primary settlements can be expected as well as additional secondary settlements; further advice should be obtained if such higher loads are to be considered.

Differential settlement will be likely due to variation in clay thickness/extent as well as due to varying structural loads and supports (e.g. between piled and non-piled elements). This will need to be considered in the development design, e.g. detailing of gravity services and other entry points as well as other parts of the development, noting they will be remaining settlements in the existing roads and filled areas due to that fill.

## 6.6 Basement Design

If that partly in-ground basement is constructed below expected groundwater levels then tanking/ waterproofing and catering for hydrostatic uplift would be required. Basement walls above design water levels should have drainage behind them to cater for any localised seepage from the surface and to prevent water pressures on the wall. Because the wall is propped by the ground floor/podium slab an at rest active earth pressure coefficient of 0.5 would be appropriate for design of walls retaining the materials encountered. Walls should be designed for surcharge loads by multiplying the surcharge by the earth pressure coefficient. Unless walls are designed for surcharges from compaction equipment, only small hand guided equipment should be used behind walls.

## 6.7 Site Classification

This structure is outside the scope of Australian Standard AS 2870-2011 *Residential slabs and footings* but the site classification derived in accordance that standard can provide an indication of the likely magnitude of reactive (shrink and swell) movements associated with normal seasonal soil moisture variations and is required for hydraulic design.

Due to the presence of uncontrolled fill and potential consolidations settlements, the site would be classified **Class P** in accordance with AS 2870-2011. Ground surface movement due to seasonal moisture variation ( $\gamma_s$  value) for at this site are likely to be negligible due to the presence of surface sands. However, consolidation settlement will be the main ground movement criteria for design (refer Section 6.5). Based on available information, provided there are no large development loads not supported on piles, *Class H1* could be adopted for plumbing design.

## 6.8 Foundations

Due to the compressible soils with settlement potential as well as the presence of very loose and loose silty sands which may be susceptible to liquefaction under earthquake conditions, the structure will need to be fully suspended on piles (including the basement slab).

Driven precast concrete piles are considered suitable, founded in the dense gravel alluvium expected from approximately 30 m to 32 m BGL. Piles driven to set would achieve the full structural capacity of the piles. Driven piles generate vibrations, however as there are no structures close to the site the impacts are expected to be manageable by a competent piling contractor.

Alternatively, CFA piles could be considered, founding in the dense materials at depth. Bored piles are likely to encounter construction difficulty due to the loose/soft soils and groundwater and would be unsuitable. The ultimate geotechnical strengths ( $R_{d,ug}$ ) given in Table 1 may be adopted for the design of CFA piles.

**Table 4: Ultimate Geotechnical Strengths ( $R_{d,ug}$ ) for CFA Pile Design.**

| Strata   | Unfactored Ultimate Shaft Adhesion (kPa) | Unfactored Ultimate End Bearing (kPa) |
|--|--|---------------------------------------|
| Soft to Firm clays or Loose / Very Loose sands | -  | -                                     |
| Medium Dense sands and Stiff to Hard clays     | 25                                       | -                                     |
| Dense to Very Dense sandy gravel               | 100                                      | 1,800                                 |

The  $R_{d,ug}$  values provided in Table 1 above will need to be multiplied by a suitable geotechnical strength reduction factor ( $\Phi_{gb}$ ) to obtain design geotechnical strength ( $R_{d,g}$ ) of piles in compression and tension. Where no load testing is proposed, and after assessing the design average risk rating (ARR) in accordance with the guidelines presented in AS 2159, a  $\Phi_{gb}$  value of 0.45 is suggested for preliminary design but higher values may be possible depending on verification testing undertaken.

Where piles are designed to carry tension loads, the shaft adhesion values provided above are to be used, multiplied by a suitable  $\Phi_{gb}$  value. Where pile load testing is undertaken on a sufficient number of piles for compression loads the use of higher  $\Phi_{gb}$  values may be possible, in accordance with AS 2159.

If working stress methods are used in pile design, the  $R_{d,ug}$  values should be divided by a factor of safety of 2.5 to calculate the maximum single pile working load.

Piles should be designed and installed by an appropriately experienced contractor and in accordance with AS 2159-2009 (Ref.5).

If any soil conditions encountered during footing construction are found to differ from those noted in the geotechnical investigation, Core should be notified immediately, and further assessment carried out to determine if changes to footing design are required.

All footings should be founded such that they are not adversely affected by any adjacent excavations, batter slopes, trenches, or retaining walls that are not designed to support building loads. To minimise the potential for any adverse interaction effects, footings should be founded at least below a plane extending 1 m horizontally from the base of trenches/batter slopes/excavations/retaining walls, then rising up at 1V:1H. This requirement is illustrated in Diagram 1.

Diagram 1: Exclusion zone for base of footings.

## 6.9 Site Sub-soil Classification

The shear wave velocities indicated in the geophysical testing are very low, typically about 100 m/s in the upper 8 m then increasing to about 150 m/s; velocities of over 250 m/s were encountered about 16 m BGL. The AS1170.4-2007 *Structural design actions* site subsoil classification for earthquake actions design is considered to be *Class D<sub>e</sub> – Deep or soft soil site*, due to the presence of very soft and very loose soils.

## 6.10 Aggressivity of Soils

Chemical analysis can provide an indication of the potential for long term damage to foundations, buried pipelines, in-ground structures, services and other infrastructure. Soil texture is also important in this regard, as granular soils allow oxygen exchange (oxidation) to occur more readily and are also more permeable.

Australian Standard AS 2159-2009 *Piling - Design and installation* provides the range of exposure classification of the surface of steel piles and concrete piles based on the range of chemical conditions in the soil and the possibility of changes in groundwater levels.

Exposure classifications will be provided on receipt of laboratory testing results, as follows:

- For concrete piles in soil, *Non-aggressive* in accordance with Table 6.4.2(C) of AS 2159-2009
- For steel piles in soil, *Non-aggressive* in accordance with Table 6.5.2(C) of AS 2159-2009.

## 6.11 Pavements

It is expected the basement will be fully suspended, so pavements relying on ground support would only likely comprise the crossover and entrance driveways. Design parameters for pavements will depend on the subgrade materials present after earthworks and the type, depth and quality of any fill used (if any) to bring the site to design levels. If subgrade conditions exposed following earthworks differ from those encountered in the boreholes, further subgrade evaluation (including further testing) should be undertaken during the construction stage.

The likely subgrade conditions for on-ground pavements (such as entry driveways) could comprise sand or clay fill. The laboratory CBR test on a sandy clay sample returned a CBR value of 6% in Lot 18 (Lot 6 SP326594) and 11% in more gravelly material in Lot 17 (Lot 5 SP326594). A preliminary design CBR of 5% is recommended for the sandy clay fill.

Properly drained subgrades should allow for open graded drains that shed water and prevent ponding.

## 7.0 ACID SULFATE SOIL ASSESSMENT

The development of ASS is commonly the result of marine or estuarine deposition of sulfate and iron bearing sediments in the presence of an abundant source of readily decomposable organic matter resulting in the deposition of pyrite. This pyrite is stable within the soil so long as anoxic conditions prevail. Oxidation of this material produces acidic conditions and oxidation typically occurs as the material is exposed above the water table by excavation, and by lowering the water table during dewatering processes.

Previous experience and available guidelines indicate that ASS are normally restricted in extent to recent (Holocene to Pleistocene age) soil horizons deposited in a saline environment below RL 5 m. The National Acid Sulfate Soils sampling and identification methods manual indicates that sites should be investigated for ASS materials if there is any evidence that reasonably suggests that ASS materials may be present in the vicinity, and that these materials may be disturbed. Examples of such evidence may include the following:

- Soil materials disturbance of 100 m<sup>3</sup> or more located within an area mapped with at least a moderate risk of ASS materials occurring within 3 m of the natural soil surface.
- Soil materials disturbance of 100 m<sup>3</sup> or more, with excavation likely from below the natural water table, in an area with at least a moderate risk of ASS materials occurring within 3 m of the natural soil surface, or with at least a moderate risk of ASS materials occurring deeper than 3 m of the natural soil surface.
- Temporary or permanent lowering of the water table in areas mapped with a risk of ASS materials occurring within 3 m of the natural soil surface.

The topography of the site is consistent with the above criteria (i.e. surface elevation below RL 5 m AHD) and the proposed development involves excavations that will exceed the above trigger levels. Due to the proposed excavation works required, an assessment of potential disturbance of ASS is required.

### 7.1 Investigation Aims

The aims of this investigation were to:

- Conduct an ASS assessment in general accordance with the National Sampling Guidelines.
- Quantitatively identify the presence or absence of ASS across the site.
- If necessary, assess the likely impact of the proposed development on ASS and groundwater.
- If necessary, provide prudent management measures so that the release of acid leachate from disturbed soil and groundwater does not have significant adverse effects on the natural and built environment or human health.

The results of the ASS investigation are set out in the following sections.

---

## 7.2 Groundwater Conditions

A groundwater sample was collected from MW01 to MW04 to provide a baseline reading of the groundwater conditions. The following groundwater test results were obtained:

Site 17 (Currently Lot 5 SP337697 and located off-site) - MW03 & MW04:

- Neutral conditions (pH 7.00 to 6.97).
- Electrical conductivity reported saline conditions.
- Alkalinity (Bicarbonate as CaCO<sub>3</sub>) was reported in groundwater (MW03 & MW04) above 200mg/L.
- Chloride was reported in groundwater (MW04) with a concentration of 11,000 mg/L and sodium at 10,000 mg/L.
- Elevated heavy metals were reported including iron, magnesium and potassium. MW04 has high levels of magnesium and potassium. This is common in these groundwater environments and potentially due to the high turbidity observed in MW03 & MW04.
- Calcium is considered high (330 mg/L) within MW04 due to potential lime existing within the dredged spoil.

Site 18 (Lot 6 SP326594) - MW01 & MW02:

- Neutral conditions (pH 7.09 to 6.51).
- Electrical conductivity reported brackish conditions.
- Alkalinity (Bicarbonate as CaCO<sub>3</sub>) was reported in groundwater (MW01 & MW02) above 200mg/L.
- Elevated heavy metals were reported including iron, aluminium and calcium. MW01 has high levels of total aluminium, total and dissolved iron and calcium. This is common in these groundwater environments and potentially due to high turbidity. Calcium is considered high due to potential lime existing within the dredged spoil.

A copy of the groundwater results is provided in Appendix E.

## 7.3 Preliminary Screening

Results of preliminary screening are summarised in Table D1 (Appendix D).

The mean soil pH (represented by pH<sub>F</sub> results) was 8.5, ranging from pH 7.2 to pH 9.1.

The preliminary screening results indicate a low probability of actual (existing) acid sulfate soils (AASS) and a low to moderate potential for potential acid sulfate soils (PASS).

## 7.4 Quantitative Soils Analysis

Table 5 below shows the ASS action levels adopted in Queensland. These categories are used to identify whether action / management of ASS spoil is required, based on 'net acidity'. For major fill works and disturbances of more than 1,000 tonnes, an action criterion of 0.03% S equivalents (18 moles / tonne) is adopted for all soil types. We estimate more than about 1000 m<sup>3</sup> of material will be excavated (e.g. stripping, footings, ground slabs, basements), therefore, we have adopted > 1000 tonnes as the criteria for this investigation.

**Table 5: ASS Action Criteria.**

| Type of Material   |                         | Action Criteria<br>1-1000 tonnes disturbed |  | Action Criteria<br>> 1000 tonnes disturbed<br>(and major fill projects) |   |
|--|-------------------------|--|--|---|---|
|  |                         | Existing + Potential Acidity               |  | Existing + Potential Acidity  |   |
| Texture range McDonald et al. (1990)                         | Approx clay content (%) | Equivalent sulfur %S oxidisable            | Equivalent acid mol H <sup>+</sup> / tonne | Equivalent sulfur %S oxidisable (oven-dry basis)                        | Equivalent acid mol H <sup>+</sup> / tonne (oven-dry basis) |
| <b>Coarse Texture</b><br>Sands to loamy sands                | ≤5                      | 0.03                                       | 18   | 0.03  | 18  |
| <b>Medium Texture</b><br>Sandy loams to light clays          | 5 – 40                  | 0.06                                       | 36   | 0.03  | 18  |
| <b>Fine Texture</b><br>Medium to heavy clays and silty clays | ≥40                     | 0.10                                       | 62   | 0.03  | 18  |

Results of quantitative analysis carried out are summarised in Table D1, attached. Laboratory test certificates are also included in Appendix D.

Results of the 17 samples analysed are summarised below:

- All 17 samples returned Titratable Actual Acidity (TAA) results below the Action Criteria of 18 mol H<sup>+</sup>/ tonne with <2 mole H<sup>+</sup>/t concentrations provided.
- Twelve (12) samples, returned Oxidisable Sulfur as Scr above the Action Criteria of 0.03%S ranging from 0.01 to 0.68%S.
- Fourteen (14) samples returned pH KCl values exceeding pH 6.5 and as such, these 14 samples were subjected to analysis for acid neutralising capacity (ANC) and reported concentrations ranging up to 1220 mole H<sup>+</sup>/t.
- No samples returned pH HCl value of pH 4.5 and therefore were not tested for retained acidity (S<sub>NAS</sub>).

Concentrations of acid neutralising capacity (ANC) were high in fourteen samples >250 mole H<sup>+</sup>/t. ANC can be an indicator of a natural lime source (e.g. shells). Shells (small in size) were observed throughout the soil profile particularly in the dredged materials. For 12 of the 17 samples analysed, net acidity exceeded the relevant QASSIT 'Action Criteria' indicating that management and/or lime neutralisation treatment will be required if these soils are disturbed.

## 7.5 Extent and Severity

The results from this investigation indicate high levels of potential acidity are distributed throughout the soil profile (up to 3.0 m BGL). The results also suggest previous liming has occurred. At this stage without documentation regarding previous lime treatment, we have considered the net acidity (excluding ANC). This may change once the Management Plan has been prepared.

The SPP14 Guidelines require that the level of treatment for management of ASS is based on treatment of all existing and potential acidity. The results of the laboratory testing have been accumulated in an Acid-Base Account to give the Net Acidity for each sample in units of mol H<sup>+</sup>/tonne as presented in Table D1 (excluding ANC), attached. This value has been calculated from sulfur trail potential acidity (S<sub>Cr</sub>) plus actual acidity (TAA).

A preliminary liming rate has been calculated in kg CaCO<sub>3</sub>/t and kg CaCO<sub>3</sub>/m<sup>3</sup> using a factor of safety (fineness factor) of 1.5 and an assumed bulk density of 1.8 tonne/m<sup>3</sup>. Consideration of the tabulated laboratory results indicates that high levels of potential acidity are fairly uniformly distributed throughout the soil profile.

Due to the difficulty in mixing the soft silty clay material and the presence of lime within the dredge spoil fill, it is considered that adoption of a uniform liming rate, not exceeding the 90th percentile of relevant test results for 'net acidity', i.e., 50 kg CaCO<sub>3</sub>/m<sup>3</sup>, will be sufficiently conservative to limit the risk of environmental impact. Soils have been separated into two types the surface Gravelly Clay Fill to 0.75m BGL and the lower alluvial Clays and dredging spoil from 0.75 m BGL. Table 6 below provides the recommended liming rates calculated for each soil type.

**Table 6: Recommended Liming Rates**

| Soil Type                            | Colour                                | Bottom of Layer, Depth Range | Treatment Rate**                        |
|--------------------------------------|---------------------------------------|------------------------------|---|
| Gravelly Clay (Fill)                 | Brown                                 | 0.0 – 0.75 m BGL             | Nil                                     |
| Alluvial Clays / Fill Dredging Spoil | Grey, dark grey, dark brown and black | 0.75 – 3.0 m BGL*            | 50 kg CaCO <sub>3</sub> /m <sup>3</sup> |

Note: \* Maximum depth of ASS sampling and analysis

\*\* Liming rate based on 90<sup>th</sup> percentile values.

## 7.6 Risk Assessment

As the proposed excavations will intersect soils with potential acidity, there will be a requirement for management of that acidity. Given the anticipated volume of soils that will be disturbed (calculated to be greater than 1,000 m<sup>3</sup>) and required lime treatment, management of potential acidity at this site would be classified as XH (Extra high) treatment in accordance with Queensland Soil Management Guidelines V4.0 - Table 4.2 (i.e. > 25 tonnes of aglime).

The Guidelines require that for Category XH treatment a stand-alone Acid Sulfate Soil Management Plan (ASS MP) must be provided. Recommendations on strategies included in the ASS MP are outlined below in Section 7.7.

Based on the results of the investigation and the currently proposed earthworks are in discussion to 3.5 m BGL (approximately 1.0m RL), the risk of impact to the surrounding environment is considered moderate. Provided that an ASS MP is prepared for the project and implemented, the environmental risk will be further reduced.

## 7.7 Recommendations

The results of this investigation indicate there is the likelihood of disturbance of high levels of potential acidity associated with the proposed development. Based on the net acidity values, lime treatment is considered necessary for the proposed excavation works. It is recommended that an ASS management plan (ASS MP) be developed and implemented.

The results also suggest previous liming has occurred. At this stage without documentation regarding previous lime treatment, we have considered the net acidity (excluding ANC). This may change once the Management Plan has been prepared.

Potential for groundwater seepage to be encountered during earthworks and construction will be dependent upon the prevailing weather conditions at that time. All groundwater seepage (if encountered) and stormwater collected within excavations, should be directed to a holding point for regular monitoring and treatment as necessary before discharging off site.

Water quality monitoring should be undertaken for the full duration of earthworks activities.

## 8.0 LIMITATIONS

Should you require any further information please contact the undersigned. We draw your attention to the document, Limitations, which is included in Appendix F.

*Core geophysical services are conducted in a manner consistent with the level of care and skill ordinarily exercised by other members of the geophysical community currently practicing under similar circumstances and privy to not only the time limits but financial and physical constraints applicable to the services. MASW is a remote sensing geophysical method that may not detect all subsurface features and anomalies. The depth of the survey is largely dependent on the characteristics of the subsurface conditions, survey parameters and quality of data obtained. Interpreted features such as service utilities, hazards, rock-layer constraints or subsurface soil and/or geology, faults, voids, and other geological hazards have been and can be misinterpreted upon physical sampling. Inversion of MASW data has been implemented to model and characterise subsurface condition and geological structure.*

## EXPLANATION OF NOTES, ABBREVIATIONS & TERMS USED ON BOREHOLE AND TEST PIT REPORTS

### DRILLING/EXCAVATION METHOD

|     |                    |     |                          |      |                             |
|-----|--------------------|-----|--------------------------|------|-----------------------------|
| AS  | Auger Screwing     | RD  | Rotary blade or drag bit | NQ   | Diamond Core - 47 mm        |
| AD  | Auger Drilling     | RT  | Rotary Tricone bit       | NMLC | Diamond Core - 52 mm        |
| *V  | V - Bit            | RAB | Rotary Air Blast         | HQ   | Diamond Core - 63 mm        |
| T   | TC - Bit, e.g. ADT | RC  | Reverse Circulation      | HMLC | Diamond Core – 63mm         |
| HA  | Hand Auger         | PT  | Push Tube                | BH   | Tractor Mounted Backhoe     |
| ADH | Hollow Auger       | CT  | Cable Tool Rig           | EX   | Tracked Hydraulic Excavator |
| DTC | Diatubre Coring    | JET | Jetting                  | EE   | Existing Excavation         |
| WB  | Washbore or Bailer | NDD | Non-destructive digging  | HAND | Excavated by Hand Methods   |

### PENETRATION/EXCAVATION RESISTANCE

- L Low resistance** . Rapid penetration possible with little effort from the equipment used
- M Medium resistance**. Excavation possible at an acceptable rate with moderate effort from equipment used
- H High resistance to penetration/excavation**. Further penetration is possible at a slow rate
- R Refusal or Practical Refusal**. No further progress possible without the risk of damage or unacceptable wear to the digging implement or machine.

These assessments are subjective and are dependent on many factors including the equipment power, weight, condition of excavation or drilling tools, and the experience of the operator.

### WATER

Water level shown at date

Water inflow

Partial water loss

Complete water loss

**GROUNDWATER NOT OBSERVED** The observation of groundwater whether present or not, was not possible due to drilling water, surface seepage or cave in of the borehole/test pit.

**GROUND WATER NOT ENCOUNTERED** The borehole/test pit was dry soon after excavation. However, groundwater could be present in less permeable strata. Inflow may have been observed had the borehole/test pit been left open for a longer period.

### SAMPLING AND TESTING

|             |  |   |
|-------------|--|---|
| SPT         | Standard Penetration Test to AS1289.6.3.1-2004   |   |
| 4,7,11 N=18 | 4,7,11 = Blows per 150mm   | N = Blows per 300mm penetration following 150mm seating |
| 30/80mm     | Where practical refusal occurs, the blows and penetration for that interval are reported |   |
| RW          | Penetration occurred under the rod weight only   |   |
| HW          | Penetration occurred under the hammer and rod weight only                                |   |
| HB          | Hammer double bouncing on anvil  |   |
| DS          | Disturbed Sample   |   |
| BDS         | Bulk disturbed sample  |   |
| G           | Gas Sample   |   |
| W           | Water sample   |   |
| FP          | Field permeability test over section noted   |   |
| FV          | Field vane shear test expressed as uncorrected shear strength (sv = peak value)          |   |
| PID         | Photoionisation Detector reading in ppm  |   |
| PM          | Pressuremeter test over section noted  |   |
| PP          | Pocket penetrometer test expressed as instrument reading in kPa                          |   |
| U63         | Thin walled tube sample - number indicates nominal sample diameter in millimetres        |   |
| WPT         | Water pressure tests   |   |
| DCP         | Dynamic cone penetration test  |   |
| CPT         | Dynamic cone penetration test  |   |
| CPTu        | Static cone penetration test with pore pressure (u) measurement                          |   |

### ROCK CORE RECOVERY

TCR = Total Core Recovery (%)

SCR = Solid Core Recovery (%)

RQD = Rock Quantity Designation (%)

$$= \frac{\text{Length of core recovered}}{\text{Length of core run}} \times 100$$

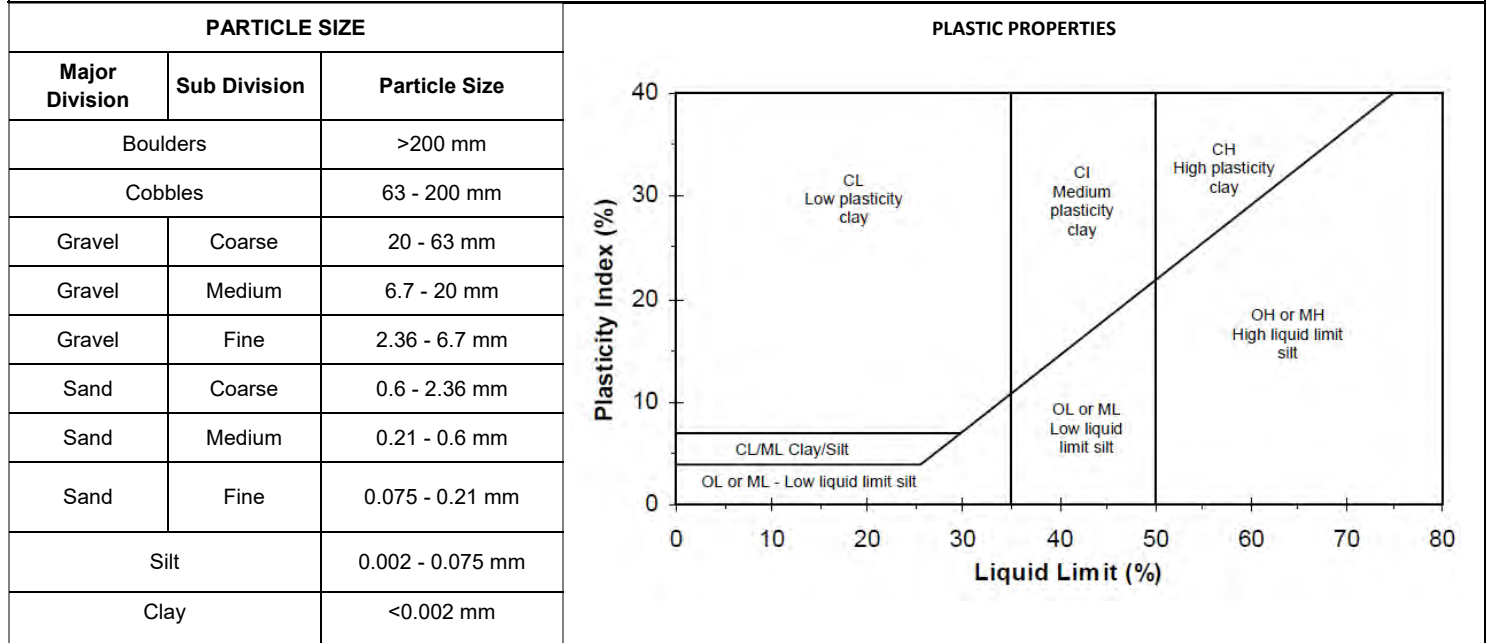

$$= \frac{\sum \text{Length of cylindrical core recovered}}{\text{Length of core run}} \times 100$$

$$= \frac{\sum \text{Axial lengths of core > 100 mm}}{\text{Length of core run}} \times 100$$

|   |                   |   |                                |
|---|-------------------|---|--------------------------------|
|  | FILL              |  | CLAY (CL, CI, or CH)           |
|  | GRAVEL (GP or SW) |  | ORGANIC SOILS (OL or OH or Pt) |
|  | SAND (SP or SW)   |  | COBBLES or BOULDERS            |
|  | SILT (ML or MH)   |   |                                |

Combinations of these basic symbols may be used to indicate mixed materials such as sandy clay.

**CLASSIFICATION AND INFERRED STRATIGRAPHY**  
 Soil and Rock is classified and described in Reports of Boreholes and Test Pits using the preferred method given in AS 1726 - 2017. The material properties are assessed in the field by visual/tactile methods.

| MOISTURE CONDITION FOR COARSE GRAINED SOIL AS 1726 - 2017 |       |   |
|---|-------|---|
| Symbol  | Term  | Description   |
| D   | Dry   | Non-cohesive and free running   |
| M   | Moist | Soil feels cool, darkened in colour, tends to stick together                              |
| W   | Wet   | Soil feels cool, darkened in colour, soil sticks together, free water forms when handling |

| MOISTURE CONDITION FOR FINE GRAINED SOIL AS1726 - 2017 |                             |  |
|--|-----------------------------|--|
| Symbol   | Term                        | Description  |
| W<PL   | Moist dry of liquid limit   | Hard and friable or powdery  |
| W = PL   | Moist near plastic limit    | Soils can be molded at a moisture condition approximately equal to the plastic limit |
| W >PL  | Moist, wet of plastic limit | Soils usually weakened and free water forms on hands when handling                   |
| W = LL   | Wet near plastic limit      |  |
| W > LL   | Wet, wet of liquid limit    |  |

| CONSISTENCY TERMS FOR COHESIVE SOILS |            | AS1726—2017              | RELATIVE DENSITY OF COARSE GRAINED SOILS   |              | AS1726—2017     |           |
|--------------------------------------|------------|--------------------------|--|--------------|-----------------|-----------|
| Symbol                               | Term       | Undrained Shear Strength | Symbol   | Term         | Density Index % | SPT 'N' # |
| VS                                   | Very Soft  | 0 to 12 kPa              | VL   | Very Loose   | Less than 15    | 0 to 4    |
| S                                    | Soft       | 12 to 25 kPa             | L  | Loose        | 15 to 35        | 4 to 10   |
| F                                    | Firm       | 25 to 50 kPa             | MD   | Medium Dense | 35 to 65        | 10 to 30  |
| St                                   | Stiff      | 50 to 100 kPa            | D  | Dense        | 65 to 85        | 30 to 50  |
| VSt                                  | Very Stiff | 100 to 200 kPa           | VD   | Very Dense   | Above 85        | Above 50  |
| H                                    | Hard       | Above 200 kPa            | In the absence of test results, consistency and density may be assessed from correlations with the observed behaviour of the material. |              |                 |           |

## TERMS FOR ROCK MATERIAL STRENGTH & WEATHERING AND ABBREVIATIONS FOR DEFECT DESCRIPTIONS

| ROCK MATERIAL STRENGTH CLASSIFICATION |                         |                                     |                                      | AS1726—2017   |
|---------------------------------------|-------------------------|-------------------------------------|--------------------------------------|---|
| Symbol                                | Term                    | Uniaxial Compressive Strength (MPa) | Point Load Strength $I_s$ (50) (MPa) | Field Guide   |
| VL                                    | Very Low Strength       | 0.6 to 2                            | 0.03 to 0.1                          | Material crumbles under firm blows with sharp end of pick. Pieces up to 30 mm thick can be broken with finger pressure.   |
| L                                     | Low Strength            | 2 to 6                              | 0.1 to 0.3                           | Easily scored with knife. Indentations 1 mm to 3 mm show in the specimen with firm blows of the pick point. A piece of core 150 mm by 50 mm may be broken by hand. Sharp edges of core are friable and break during handling. |
| M                                     | Medium Strength         | 6 to 20                             | 0.3 to 1                             | Readily scored with a knife. A piece of core 150 mm by 50 mm can be broken by hand with difficulty.   |
| H                                     | High Strength           | 20 to 60                            | 1 to 3                               | A piece of core 150 mm by 50 mm cannot be broken by hand but can be broken by a pick with a single firm blow. Rock rings under hammer.  |
| VH                                    | Very High Strength      | 60 to 200                           | 3 to 10                              | Hand specimen breaks with pick after more than one blow. Rock rings under hammer.   |
| EH                                    | Extremely High Strength | Above 200                           | Above 10                             | Specimen requires many blows with geological pick to break through intact material. Rock rings under hammer.  |

● = Diametral Point Load Test      ▼ = Axial Point Load Test

| CLASSIFICATION OF MATERIAL WEATHERING |   | AS1726—2017   |
|---------------------------------------|---|---|
| Symbol                                | Term  | Field Guide   |
| RS                                    | Residual Soil ( <i>Note 1</i> )   | Material is weathered to such an extent that it has soil properties. Mass structure and material texture and fabric of original rock are no longer visible but the soil has not been significantly transported.   |
| XW                                    | Extremely Weathered ( <i>Note 1</i> )   | Material is weathered to such an extent that it has soil properties. Mass structure and material texture and fabric of original rock are still visible.   |
| HW                                    | Highly Weathered ( <i>Note 2</i> )  | The whole rock mass is discoloured, usually by iron staining or beaching to the extent that the colour of the original rock is not recognizable. Rock strength is significantly changed by weathering. Some primary minerals have weathered to clay minerals. Porosity may be increased by leaching, or may be decreased due to deposition of weathering products in pores. |
| MH                                    | Moderately Weathered ( <i>Note 2</i> )  | The whole of the rock material is discoloured, usually by iron staining or bleaching to the extent that the colour of the original rock is not recognizable, but shows little or no change in strength from fresh rock.   |
| SW                                    | Slightly Weathered  | Rock is partially discoloured with staining or bleaching along joints but shows little or no change of strength from fresh rock.  |
| FR                                    | Fresh   | Rock shows no signs of decomposition of individual minerals or colour change.   |
| <b>Note 1</b>                         | The term 'Extremely Weathered rock' is misleading as the material has soil properties. The word 'rock' should be replaced with the name of the original rock or the word 'material', eg. Extremely Weathered granite or Extremely Weathered material. |   |
| <b>Note 2</b>                         | Where it is not possible to distinguish between 'Highly Weathered' and 'Moderately Weathered' rock the term 'Distinctly Weathered' may be used.   |   |

| DEFECT TYPE/DESCRIPTION |                          |        |                         | DEFECT PROFILE                   |                           | DEFECT ROUGHNESS   |             |

## Internal Quality Control Review and Glossary

### General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
- Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
- Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
- For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
- Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
- SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
- Samples were analysed on an 'as received' basis.
- Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
- This report replaces any interim results previously issued.

### Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

### Units

|  |   |  |
|--|---|--|
| <b>mg/kg:</b> milligrams per kilogram            | <b>mg/L:</b> milligrams per litre         | <b>ppm:</b> parts per million  |
| <b>µg/L:</b> micrograms per litre                | <b>ppb:</b> parts per billion             | <b>%:</b> Percentage   |
| <b>org/100 mL:</b> Organisms per 100 millilitres | <b>NTU:</b> Nephelometric Turbidity Units | <b>MPN/100 mL:</b> Most Probable Number of organisms per 100 millilitres |
| <b>CFU:</b> Colony Forming Unit                  | <b>Colour:</b> Pt-Co Units (CU)           |  |

### Terms

|                         |  |
|-------------------------|--|
| <b>APHA</b>             | American Public Health Association   |
| <b>CEC</b>              | Cation Exchange Capacity   |
| <b>COC</b>              | Chain of Custody   |
| <b>CP</b>               | Client Parent - QC was performed on samples pertaining to this report  |
| <b>CRM</b>              | Certified Reference Material (ISO17034) - reported as percent recovery.  |
| <b>Dry</b>              | Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.   |
| <b>Duplicate</b>        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| <b>LOR</b>              | Limit of Reporting.  |
| <b>LCS</b>              | Laboratory Control Sample - reported as percent recovery.  |
| <b>Method Blank</b>     | In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.   |
| <b>NCP</b>              | Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.   |
| <b>RPD</b>              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| <b>SPIKE</b>            | Addition of the analyte to the sample and reported as percentage recovery.   |
| <b>SRA</b>              | Sample Receipt Advice  |
| <b>Surr - Surrogate</b> | The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.  |
| <b>TBTO</b>             | Tributyltin oxide ( <i>bis</i> -tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits. |
| <b>TCLP</b>             | Toxicity Characteristic Leaching Procedure   |
| <b>TEQ</b>              | Toxic Equivalency Quotient or Total Equivalence  |
| <b>QSM</b>              | US Department of Defense Quality Systems Manual Version 6.0  |
| <b>US EPA</b>           | United States Environmental Protection Agency  |
| <b>WA DWER</b>          | Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA  |

### QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

|                                      |                            |
|--------------------------------------|----------------------------|
| Results <10 times the LOR:           | No Limit                   |
| Results between 10-20 times the LOR: | RPD must lie between 0-50% |
| Results >20 times the LOR:           | RPD must lie between 0-30% |

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

### QC Data General Comments

- Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
- pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
- For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
- Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

**Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.**

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

| <i>Signatories</i> | <i>Position</i>                  | <i>Accreditation Category</i>               |

| Ben Felgendrejeris | Senior Acid Sulfate Soil Chemist | Brisbane Acid Sulphate Soils, Stafford, QLD |

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

~ = Indicates an estimated value.

- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :  
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
 LOR = Limit of reporting  
 RPD = Relative Percentage Difference  
 # = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

### ***Method Blank (MB) and Laboratory Control Sample (LCS) Report***

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

### ***Matrix Spike (MS) Report***

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**
-

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### Summary of Outliers

#### Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- For all regular sample matrices, where applicable to the methodology, **NO surrogate recovery outliers occur.**

#### Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

#### Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

## Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

| Quality Control Sample Type        | Method | Count |         | Rate (%) |          |            | Quality Control Specification  |
|------------------------------------|--------|-------|---------|----------|----------|------------|--------------------------------|
|                                    |        | QC    | Regular | Actual   | Expected | Evaluation |                                |
| <b>Laboratory Duplicates (DUP)</b> |        |       |         |          |          |            |                                |
| ASS Field Screening Analysis       | EA037  | 8     | 72      | 11.11    | 10.00    | ✔          | NEPM 2013 B3 & ALS QC Standard |

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| <i>Analytical Methods</i>    | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i>   |
|------------------------------|---------------|---------------|--|
| ASS Field Screening Analysis | * EA037       | SOIL          | In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines. As received samples are tested for pH field and pH fox and assessed for a reaction rating. |

| <i>Preparation Methods</i> | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i> |
|----------------------------|---------------|---------------|----------------------------|
| Drying only                | EN020D        | SOIL          | In house                   |

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

**Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.**

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
LOR = Limit of reporting  
^ = This result is computed from individual analyte detections at or above the level of reporting  
~ = Indicates an estimated value.

- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### *Signatories*

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :  
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
 LOR = Limit of reporting  
 RPD = Relative Percentage Difference  
 # = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

### ***Method Blank (MB) and Laboratory Control Sample (LCS) Report***

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

### ***Matrix Spike (MS) Report***

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**
-

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### Summary of Outliers

#### Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- For all regular sample matrices, where applicable to the methodology, **NO surrogate recovery outliers occur.**

#### Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

#### Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

## Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: \* = Holding time breach ; ✓ = Within holding time.

| Method<br>Container / Client Sample ID(s)  | Sample Date   | Extraction / Preparation |                    |             | Analysis      |                  |             |   |

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

| Quality Control Sample Type        | Method | Count |         | Rate (%) |          |            | Quality Control Specification  |
|------------------------------------|--------|-------|---------|----------|----------|------------|--------------------------------|
|                                    |        | QC    | Regular | Actual   | Expected | Evaluation |                                |
| <b>Laboratory Duplicates (DUP)</b> |        |       |         |          |          |            |                                |
| ASS Field Screening Analysis       | EA037  | 6     | 56      | 10.71    | 10.00    | ✔          | NEPM 2013 B3 & ALS QC Standard |

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| <i>Analytical Methods</i>    | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i>   |
|------------------------------|---------------|---------------|--|
| ASS Field Screening Analysis | * EA037       | SOIL          | In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines. As received samples are tested for pH field and pH fox and assessed for a reaction rating. |

| <i>Preparation Methods</i> | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i> |
|----------------------------|---------------|---------------|----------------------------|
| Drying only                | EN020D        | SOIL          | In house                   |

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

**Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.**

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

| Signatories        | Position                         | Accreditation Category                      |

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
LOR = Limit of reporting  
^ = This result is computed from individual analyte detections at or above the level of reporting  
ø = ALS is not NATA accredited for these tests.  
~ = Indicates an estimated value.

- ASS: EA033 (CRS Suite): Analysis is performed as per the Acid Sulfate Soils Laboratory Methods Guidelines (2004) and the updated National Acid Sulfate Soils Guidance: National acid sulfate soils identification and laboratory methods manual, Department of Agriculture and Water Resources, Canberra, ACT (2018)
- ASS: EA033 (CRS Suite): Retained Acidity not required because pH KCl greater than or equal to 4.5
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO<sub>3</sub>) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m<sup>3</sup> in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m<sup>3</sup>'.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :  
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
 LOR = Limit of reporting  
 RPD = Relative Percentage Difference  
 # = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: SOIL

### Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

## QA/QC Compliance Assessment to assist with Quality Review

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### Summary of Outliers

#### Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- For all regular sample matrices, where applicable to the methodology, **NO surrogate recovery outliers occur.**

#### Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

#### Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

## Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for **VOC in soils** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: \* = Holding time breach ; ✓ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| <i>Analytical Methods</i>                         | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i>  |
|---|---------------|---------------|---|
| Chromium Suite for Acid Sulphate Soils            | EA033         | SOIL          | In house: Referenced to Ahern et al 2004. This method covers the determination of Chromium Reducible Sulfur (SCR); pHKCl; titratable actual acidity (TAA); acid neutralising capacity by back titration (ANC); and net acid soluble sulfur (SNAS) which incorporates peroxide sulfur. It applies to soils and sediments (including sands) derived from coastal regions. Liming Rate is based on results for samples as submitted and incorporates a minimum safety factor of 1.5. |

Hi Carsten,

Can I please have additional testing on the following samples:

Analysis:  
Chromium Suite (Including and excluding ANC)

Samples:  
BH101 0-0.25 m (EB2421233-001 )  
BH2 0-0.25m (EB2421232-013 )

Thanks,  
Christie

| Ben Felgendrejeris | Senior Acid Sulfate Soil Chemist | Brisbane Acid Sulphate Soils, Stafford, QLD |

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
LOR = Limit of reporting  
^ = This result is computed from individual analyte detections at or above the level of reporting  
ø = ALS is not NATA accredited for these tests.  
~ = Indicates an estimated value.

- ASS: EA033 (CRS Suite): Analysis is performed as per the Acid Sulfate Soils Laboratory Methods Guidelines (2004) and the updated National Acid Sulfate Soils Guidance: National acid sulfate soils identification and laboratory methods manual, Department of Agriculture and Water Resources, Canberra, ACT (2018)
- ASS: EA033 (CRS Suite): Retained Acidity not required because pH KCl greater than or equal to 4.5
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane.
- ASS: EA033 (CRS Suite): Laboratory determinations of ANC needs to be corroborated by effectiveness of the measured ANC in relation to incubation ANC. Unless corroborated, the results of ANC testing should be discounted when determining Net Acidity for comparison with action criteria, or for the determination of the acidity hazard and required liming amounts.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO<sub>3</sub>) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m<sup>3</sup> in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m<sup>3</sup>'.

## General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :  
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
 LOR = Limit of reporting  
 RPD = Relative Percentage Difference  
 # = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: SOIL

### Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

## QA/QC Compliance Assessment to assist with Quality Review

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### Summary of Outliers

#### Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- For all regular sample matrices, where applicable to the methodology, **NO surrogate recovery outliers occur.**

#### Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

#### Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

## Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: SOIL

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

| Method<br>Container / Client Sample ID(s)            | Sample Date | Extraction / Preparation |                    |            | Analysis      |                  |            |

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| <i>Analytical Methods</i>              | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i>  |
|--|---------------|---------------|---|
| Chromium Suite for Acid Sulphate Soils | EA033         | SOIL          | In house: Referenced to Ahern et al 2004. This method covers the determination of Chromium Reducible Sulfur (SCR); pHKCl; titratable actual acidity (TAA); acid neutralising capacity by back titration (ANC); and net acid soluble sulfur (SNAS) which incorporates peroxide sulfur. It applies to soils and sediments (including sands) derived from coastal regions. Liming Rate is based on results for samples as submitted and incorporates a minimum safety factor of 1.5. |

| <i>Preparation Methods</i>                        | <i>Method</i> | <i>Matrix</i> | <i>Method Descriptions</i> |
|---|---------------|---------------|----------------------------|
| Drying at 85 degrees, bagging and labelling (ASS) | EN020PR       | SOIL          | In house                   |

# Appendix F Limitations

## LIMITATIONS

This Document has been provided by Core Consultants Pty Ltd ("Core") subject to the following limitations:

This Document has been prepared for the particular purpose outlined in Core's proposal and no responsibility is accepted for the use of this Document, in whole or in part, in other contexts or for any other purpose.

The scope and the period of Core's Services are as described in Core's proposal, and are subject to restrictions and limitations. Core did not perform a complete assessment of all possible conditions or circumstances that may exist at the site referenced in the Document. If a service is not expressly indicated, do not assume it has been provided. If a matter is not addressed, do not assume that any determination has been made by Core in regards to it.

Conditions may exist which were undetectable given the limited nature of the enquiry Core was retained to undertake with respect to the site. Variations in conditions may occur between investigatory locations, and there may be special conditions pertaining to the site which have not been revealed by the investigation and which have not therefore been taken into account in the Document. Accordingly, additional studies and actions may be required.

In addition, it is recognised that the passage of time affects the information and assessment provided in this Document. Core's opinions are based upon information that existed at the time of the production of the Document. It is understood that the Services provided allowed Core to form no more than an opinion of the actual conditions of the site at the time the site was visited and cannot be used to assess the effect of any subsequent changes in the quality of the site, or its surroundings, or any laws or regulations.

Any assessments made in this Document are based on the conditions indicated from published sources and the investigation described. No warranty is included, either express or implied, that the actual conditions will conform exactly to the assessments contained in this Document.

Where data supplied by the client or other external sources, including previous site investigation data, have been used, it has been assumed that the information is correct unless otherwise stated. No responsibility is accepted by Core for incomplete or inaccurate data supplied by others.

Core may have retained subconsultants affiliated with Core to provide Services for the benefit of Core. To the maximum extent allowed by law, the Client acknowledges and agrees it will not have any direct legal recourse to, and waives any claim, demand, or cause of action against, Core's affiliated companies, and their employees, officers and directors.

This Document is provided for sole use by the Client and is confidential to it and its professional advisers. No responsibility whatsoever for the contents of this Document will be accepted to any person other than the Client. Any use which a third party makes of this Document, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Core accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this Document.
